

Changelog & Product Updates Widget

Headway / Beamer Alternative

🔒 Universal Security & Architecture Requirements

- **Pair Token Auth:** Short-lived JWT Access Token (15m) + Long-lived Refresh Token (7d) in `httpOnly` cookies.
- **Auth Features:** Signup with Email Verification simulation, Login with token rotation, Forgot/Reset Password.
- **UI Standard:** Build all interface components using coss.com/ui primitives.

1. Overview & Goal

Develop a product update delivery hub combining an administrative Markdown studio, a public reverse-chronological timeline, and an embeddable/floating notification center with live unread counts.

2. Technical Feature Specifications

A. Admin Markdown Publishing Studio

- Split-screen live Markdown editor with image attachment support and tag selector.
- Schema attributes: `title`, `slug`, `contentMarkdown`, `category` (`#New`, `#Improved`, `#Fixed`), `coverImage`, `publishedAt`, and `status` (`Draft` vs `Published`).
- Full CRUD dashboard to draft, edit, publish, or delete updates.

B. Standalone Public Release Timeline

- Clean reverse-chronological timeline feed rendering markdown formatting, code snippets, and media.
- Category filter pills (e.g., filter exclusively by `#New` or `#Fixed`).
- Interactive emoji reaction bar (❤️, 🎉, 🚀) with per-user unique reaction tracking.

C. "What's New" In-App Notification Center

- Slide-over drawer or popover widget triggered by a floating/header bell icon.
- **Unread Tracker:** Compares user's `lastViewedChangelogDate` against publication dates to display a live unread counter badge.
- Opening the drawer marks all releases as read and clears the badge count.

D. Feed Syndication & Search

- Public read-only JSON feed endpoint (`/api/v1/changelog/feed`) for external integrations.
- Debounced keyword search across changelog titles and body content.

3. Deliverables Checklist

Area	Deliverable Criteria
------	----------------------

Auth & Security	Dual-token JWT auth, admin route protection, password reset flow.
Content Engine	Markdown live preview, unread algorithm, public JSON feed endpoint.
Frontend	Coss UI slide-over drawer, responsive timeline, reaction state handling.
Repository	Clean GitHub repo, <code>.env.example</code> , Postman collection.
